

# CS421 Lecture 1: Course Introduction<sup>1</sup>

Mark Hills

`mhills@cs.uiuc.edu`

University of Illinois at Urbana-Champaign

May 30, 2006

---

<sup>1</sup>Based on slides by Mattox Beckman, as updated by Vikram Adve, Gul Agha, and Elsa Gunter. Figures from Concepts of Programming Languages, Seventh Edition, by Robert W. Sebesta

# Welcome to CS 421!

## Outline

Objectives for Today  
Administrivia  
Grading and Homeworks  
Motivation and History  
Language Design  
Language Implementation

Objectives for Today

Administrivia

Grading and Homeworks

Motivation and History

Language Design

Language Implementation

## Today's Objectives

Your goal for this lecture is to . . .

- ▶ learn about who is teaching the class;
- ▶ learn some of the course mechanics;
- ▶ find out why this is important material to understand;
- ▶ learn some about the history of programming languages;
- ▶ learn how to classify and evaluate languages;
- ▶ gain a high-level understanding of how languages are executed.

## Contact Info – Mark Hills (Instructor)

- ▶ Office: 2111A SC
- ▶ Office Hours: Thursdays 2:00 PM - 3:30 PM (or by appointment)
- ▶ Email: [mhills@cs.uiuc.edu](mailto:mhills@cs.uiuc.edu)

## Contact Info – Ben Hildore (TA)

- ▶ Office: TBD
- ▶ Office Hours (On-Campus): TBA
- ▶ Office Hours (I2CS): Tuesday 6:30 PM - 7:30 PM, Thursday 1:00 PM - 2:00 PM
- ▶ Email: [bhillo2@uiuc.edu](mailto:bhilldo2@uiuc.edu)

## Course References

### No required textbook

- ▶ Compilers: Principles, Techniques, and Tools ("The Dragon Book"), by Aho, Sethi, and Ullman
- ▶ Programming Language Pragmatics (2nd Edition), by Michael L. Scott
- ▶ Concepts of Programming Languages (7th Edition), by Robert W. Sebesta
- ▶ Essentials of Programming Languages (2nd Edition), by Friedman, Wand, and Haynes
- ▶ Other books, papers, etc will be mentioned as we go...

## Electronic Resources

**Course Web Page** <http://www.cs.uiuc.edu/class/cs421/>.

You are expected to check the announce page daily.

**News group** `class.cs421`

You should read the news group daily also.

**Languages** OCaml, a dialect of ML.

See <http://caml.inria.fr/ocaml>

**Computer Lab** EWS labs: <http://www.ews.uiuc.edu/>

*NOTE: Contact the TAs if you do not have an EWS account.*

## Course Website

- ▶ *Main* has important news, links elsewhere
- ▶ *Policy* has rules governing the course – read this!
- ▶ *Lectures* has links to the lecture slides, plus old lectures
- ▶ *MPs* has info on the homeworks
- ▶ *Exams* has info on exams, past exams, and useful info to help prepare
- ▶ *Unit Projects* has info on projects for students registered for 4 hours
- ▶ *Resources* has links to helpful information
- ▶ *FAQ* has answers to some common course questions

## CS421 Best Practices

- ▶ Check the course web page and course news group daily.
- ▶ Attend lectures regularly and participate actively.
- ▶ Come to office hours and ask questions!
- ▶ Do the programming assignments thoroughly: they are critical
- ▶ Start an MP the day after it is out, not day before it is due!!
- ▶ **Take responsibility and initiative in learning material** — work out practice questions; do some OCaml programming; read another text (e.g., *EOPL* or *Scott*)

## Course Grading

- ▶ MPs (Machine Problems): 35% of grade, submitted electronically
- ▶ Midterm: 25%, in class June 29th
- ▶ Final: 40%, August 5th

## Course Homework

- ▶ You may discuss homeworks and their solutions with others
- ▶ You may not leave the discussion with a written solution
- ▶ You must write your own solution
- ▶ You may **not** look at another written solution when writing your own – but you *may* look at provided examples from class and other similar examples

## Unit Project

- ▶ For students registered for 4 hours
- ▶ Can work in groups of up to 3 people
- ▶ Potential projects detailed on course web page
- ▶ Fairly flexible – you should pick something you are interested in, to make it more fun
- ▶ Project proposals are due by **June 23**, but can be in earlier if you want to get a head start

# Why Study Programming Languages?

- ▶ Understand efficiency tradeoffs of different language features
- ▶ Reduce bugs by understanding language semantics better
- ▶ Make better choices of languages for specific tasks
- ▶ Use existing languages in new ways
- ▶ Learn new languages more quickly
- ▶ It's fun!

# Study of Programming Languages

- ▶ Design and Organization
  - ▶ Syntax: How a program is written
  - ▶ Semantics: What a program means
  - ▶ Implementation: How a program runs
- ▶ Major Language Features
  - ▶ Imperative/Applicative/Rule-based
  - ▶ Sequential/Concurrent

## Early History

- ▶ 1940's: programming meant modifying the *hardware*; programmers had intimate contact with the computer
- ▶ early 1950's: Early low-level languages developed
  - ▶ machine code
  - ▶ assembly language
- ▶ late 1950's - early 1960's: First higher-level languages arrive
  - ▶ Fortran
  - ▶ LISP
  - ▶ COBOL
  - ▶ ALGOL

# Structured Programming, Module Systems, and the $\lambda$ Calculus

- ▶ late 1960's - 1970's: Structured programming
  - ▶ Pascal
  - ▶ C
- ▶ late 1970's - early 1980's: Data abstraction/module systems
  - ▶ Modula-2
  - ▶ CLU
  - ▶ Ada
- ▶ 1960's:  $\lambda$  calculus really starts to influence languages
  - ▶ ISWIM (Landin)
  - ▶ ML (late 1970's)

# Object Orientation, Dynamic Languages, and the Internet

- ▶ 1980's: Object oriented languages start to catch on
  - ▶ Smalltalk
  - ▶ C++
  - ▶ Extensions to existing languages: Objective C, Object Pascal, etc
- ▶ 1990's: The Internet starts to impact languages more
  - ▶ Java
- ▶ 1990's - 2000's: Dynamic languages become more popular
  - ▶ Web scripting languages (JavaScript, etc)
  - ▶ Perl, Python, PHP
  - ▶ Some new interest in Lisp

# Imperative Languages

- ▶ Main focus: machine state the set of values stored in memory locations
- ▶ Command-driven: Each statement uses current state to compute a new state
- ▶ Syntax: S1; S2; S3; ...
- ▶ Example languages: C, Pascal, FORTRAN, COBOL, CLU, Ada

# Imperative Languages, C

```
1 while (b > 0) {  
2     a = a * 2;  
3     b = b - 1;  
4 }
```

## Imperative Languages, CLU<sup>2</sup>

```
1 Poly = cluster is create, degree, coeff, ....
2   rep = record[coeffs: array[int], lo, hi: int]
3   create = proc(c,n : int) returns (Poly)
4     A : array[int] := array[int]$create(0)
5     A[n] := c
6     return(up(rep${coeffs: A, lo: n, hi: n}))
7   end create
```

---

<sup>2</sup>from Sam Kamin's *Programming Languages: An Interpreter Based Approach*

## Object-Oriented Languages

Classes are complex data types grouped with operations (methods) for creating, examining, and modifying elements (objects); subclasses include (inherit) the objects and methods from superclasses

- ▶ Computation is based on objects sending messages (methods applied to arguments) to other objects
- ▶ Syntax: Varies, object  $\leftarrow$  method(args)
- ▶ Example languages: Java, C++, Smalltalk, Simula-67, Beta

# Object-Oriented Languages, C++

```
1 class Square {  
2 public:  
3     int x,y,h,l;  
4     Square() { x = y = h = l = 0; }  
5 };
```

# Object-Oriented Languages, Beta

```
1 (#  
2 do  
3   'Hello world!' -> putline  
4 #)
```

# Applicative/Functional Languages

Programs as functions that take arguments and return values;  
arguments and returned values may be functions

- ▶ Programming consists of building the function that computes the answer; function application and composition main method of computation
- ▶ Syntax:  $P1(P2(P3 X))$
- ▶ Example languages: ML, LISP, Scheme, Haskell, Miranda, Clean, Erlang

## Applicative/Functional Languages, OCaml

```
1 # let twice f x = f(f(x));;  
2 # let inc x = x + 1;;  
3 # inc 5;;  
4 6  
5 # twice inc 5;;  
6 7
```

## Logic/Rule-based Languages

- ▶ Programs as sets of basic rules for decomposing problem
- ▶ Computation by deduction: search, unification and backtracking main components
- ▶ Syntax: Answer : – specification rule
- ▶ Example languages: Prolog, Datalog, BNF Parsing

```
1 - human(socrates).  
2 - mortal(X) :- human(X).  
3 -? mortal(Who).  
4 Who = socrates
```

## Themes in Language Development

- ▶ Languages have become more *abstract* – abstraction of data, memory, machine errors, execution, etc
- ▶ Languages have shifted performance burden to compilers – machines used to be expensive, now people are

## Evaluation Criteria<sup>3</sup>

- ▶ Readability
- ▶ Writability
- ▶ Reliability
- ▶ Cost

---

<sup>3</sup>From Concepts of Programming Languages, 7th Edition, by Robert W. Sebesta

# Readability

- ▶ Overall Simplicity
- ▶ Orthogonality
- ▶ Control Statements (Structured Control vs. Gotos)
- ▶ Flexible Data Types and Structures
- ▶ Flexible, Consistent Syntax (identifiers, keywords, consistency)

# Writability

- ▶ Simplicity and Orthogonality
- ▶ Support for *Process* and *Data* Abstractions
- ▶ Expressivity

# Reliability

- ▶ Type Checking
- ▶ Type Safety
- ▶ Exception Handling
- ▶ Aliasing
- ▶ Readability and Writability

# Cost

- ▶ Training
- ▶ Writing programs
- ▶ Programming environment availability
- ▶ Compilation
- ▶ Execution performance
- ▶ Language implementation/execution environment expense
- ▶ Reliability
- ▶ Maintenance
- ▶ Others: Portability? Generality?

## Goals can conflict...

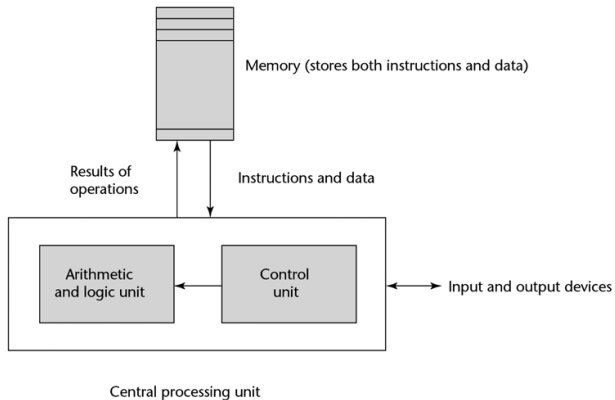

- ▶ Orthogonality is important, but too much can be confusing
- ▶ Sometimes more readable languages are not as writable, or vice versa (nested comments, overloaded operators, etc)
- ▶ Reliability and cost can be in tension – more reliable programs may be more expensive to execute

# Programming Language Implementation

- ▶ Develop layers of machines, each more primitive than the previous
- ▶ Translate between successive layers (compile or interpret)
- ▶ Ultimately, all programs execute in hardware

**Figure 1.1**

The von Neumann  
computer architecture

# Virtual Machines

- ▶ At first, programs written in assembly language (or at very first, machine language)
- ▶ Hand-coded to be very efficient
- ▶ Now, no longer write in native assembly language
- ▶ Use layers of software (eg operating system)
- ▶ Each layer makes a *virtual machine* in which the next layer is defined
- ▶ Compilers often define virtual machine layers: lambda calculus, continuations, graph reduction, etc. in functional languages, bytecode machines, etc

**Figure 1.2**

Layered interface of virtual computers, provided by a typical computer system

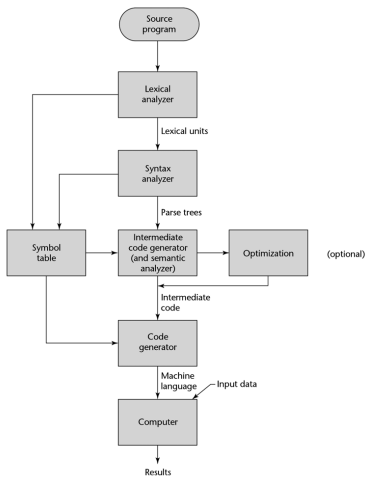

## What is a compiler?

A **compiler** from language  $L_1$  to language  $L_2$  is a program that takes an  $L_1$  program and for each piece of code in  $L_1$  generates a piece of code in  $L_2$  with the same meaning

Figure 1.3

The compilation process

## What is an interpreter?

An **interpreter** of  $L_1$  in  $L_2$  is an  $L_2$  program that executes the meaning of a given  $L_1$  program

Interpreters and compilers must know about both the *syntax* of the language and its *semantics*, and must preserve the semantics (the meaning)

**Figure 1.4**

Pure interpretation

**Figure 1.5**

Hybrid implementation system

## Compiler Front-End

- ▶ Lex: Break the source into separate tokens
- ▶ Parse: Analyze phrase structure and apply semantic actions, usually to build an abstract syntax tree
- ▶ Semantic analysis: Determine what each phrase means, connect variable name to definition (typically with symbol tables), check types

## Compiler Back-End

- ▶ Translate to IR
- ▶ Optimize: Improve generated code, while maintaining original meaning
- ▶ Instruction Selection
- ▶ Register Allocation
- ▶ Emit final code

## Sample IR

Source:

```
1 X = A + B + C;
```

Three Address Code:

```
1 %tmp.1 = A + B;  
2 X = %tmp.1 + C;
```

## Sample Optimization

Source:

```
1 while (X != 0) {  
2     B = 5;  
3     C = X + B;  
4     X = ...  
5 }
```

Target:

```
1 if (X != 0) B = 5;  
2 while (X != 0) {  
3     C = X + B;  
4     X = ...  
5 }
```

## For Further Information

- ▶ For History, most books on languages. Sebesta Chapter 2 is good, as well as Chapter 2 of Louden's Programming Languages: Principles and Practice. The books for the History of Programming Languages workshops are good in-depth sources as well. Finally, IEEE Annals of the History of Computing has articles on this theme occasionally.
- ▶ Language Design principles can be found in the same sources. Obviously, there is disagreement about which features are best, so it's best to look at multiple sources.
- ▶ For compilers, Compilers: Principles, Techniques, and Tools by Aho, Sethi, and Ullman is the classic text. Cooper and Torczon's Engineering a Compiler is a more recent treatment.
